Summary — Backend-leaning software engineering student with hands-on experience shipping AI-integrated applications – from serverless API routes calling LLMs in production to real-time, event-driven data pipelines. Comfortable working across the stack with strong fundamentals in Python and C/C++, and a genuine interest in how backend architecture supports AI inference at scale.

Education

VIPS-TC <i>BTech in Industrial Internet of Things</i>	2024 – 2028
S.R.DAV Public School <i>Secondary and Higher Secondary</i>	2022 – 2024

Skills

Backend / AI LLM API Integration (Gemini), Next.js API Routes, Serverless Deployment (Vercel)	Systems Data Structures, Event-Driven Architecture, Linux Systems
Languages Python, TypeScript, C++ , C, Bash	Tools Git, GitHub Desktop, GCC/GDB
AI / ML Computer Vision, YOLOv5, Roboflow	

Experience

Innovative Intelligent Internet of Things <i>IoT Engineer Intern</i> 2nd Internship – Fire & Spill Detection (June – Aug 2026) – Trained and deployed two independent computer vision models for real-time fire detection and spill detection from live camera feeds. 1st Internship – Screw Detection & Forecasting (July 2025) – Trained a computer vision model (Roboflow) for screw placement detection; built a regression model forecasting daily energy usage from a housing dataset.	Summer Internship – IIT Roorkee July 2025 – Completed a 7-day intensive program on Cyber Security and AI/ML, covering network security fundamentals, ethical hacking, and supervised learning through hands-on labs.
---	---

Projects

Cravix – AI Recipe Transformation App <i>Next.js 15, TypeScript, Gemini 2.0 Flash, Vercel</i> – Built server-side API routes that call the Gemini 2.0 Flash model in real time to transform any dish craving into a healthier version, with dynamic AI-generated goals and interactive tradeoff sliders. – Engineered automatic retry logic for Gemini API rate limits (429) and high-demand errors (503), with a graceful structured mock-data fallback so the product stays usable under failure; deployed on Vercel’s serverless platform.	May 2026
Real-Time Document Dependency Graph and Impact Analyzer – Engineered a Python-based, event-driven Document Watcher that monitors file system events and triggers live dependency-graph updates on modification. – Collaborated in a team of 5 to automate multi-document impact analysis, mapping interdependencies to surface downstream effects of changes in real time.	October 2025
Autonomous Field Deployment Suitability Analyzer (AFDSA) <i>ESP32, C++ , FreeRTOS</i> – Built a real-time embedded system that fuses multi-sensor data into a live Deployment Suitability Score, validated at 100% accuracy across 6 field-tested nodes – hands-on experience with the kind of real-time, low-latency data processing backend systems depend on.	March 2026 – Ongoing

Participation & Competitions

- SIH - University Level Hackathon - Cleared2025
- Built a **real-time ML pipeline** processing continuous multi-sensor input (vibration, moisture, pressure) to predict slope instability, with automated multi-channel (SMS/Email/onsite) alerting triggered on threshold breach.
- Cravix – AMD Slingshot Ideathon – 3rd PlaceMay 2026
- Won 3rd place at an AMD-sponsored ideathon for Cravix, judged on product vision and real-world AI integration.

Position of Responsibility

- Technical Lead – Game Veda (Game Dev Club, VIPS)2024 – Present
- Owns technical direction for the club’s projects and mentors junior developers – experience taking ownership of systems beyond just closing individual tickets.
